## Cubic Cut-ups

Other red cubes were cut in thirds, fourths, and fifths along each side. How many small cubes? How many cubes have:

6 red faces?
5 red faces?
4 red faces?
3 red faces?
2 red faces?
1 red face?
no red faces?

Make a table for these cubes and predict the results for the next five cubes in the sequence:

| Number of cuts <br> in each <br> direction | Number of <br> small cubes | Three red <br> faces | Number of small cubes with <br> Two red <br> faces | One red <br> face | No red faces |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 1 |  |  |  |  |  |
| 2 |  |  |  |  |  |
| 3 |  |  |  |  |  |
| 4 |  |  |  |  |  |
| 5 |  |  |  |  |  |
| 6 |  |  |  |  |  |
| 7 |  |  |  |  |  |
| 8 |  |  |  |  |  |
| 9 |  |  |  |  |  |

## Generalize:

If a cube is cut with $\mathbf{N}$ cuts in each direction, write a functio $n$ ("rule") that describes:

- The total number of small cubes formed:
- The number of small cubes with three colored faces:
- The number of small cubes with two colored faces:
- The number of small cubes with one colored face:
- The number of small cubes with no colored faces:
